The Government AI Readiness Index 2025

Since 2017, the Government AI Readiness Index has helped map the global landscape of AI preparedness, shedding light on how governments are adopting and governing AI.

While previous editions focused on implementing AI in public services, our new approach recognises that governments can also enable AI adoption across sectors, promote innovation, and safeguard against risks. The public benefits of AI—from better healthcare to improved education—depend not only on government use but also on its broader role as buyer, enabler, and regulator.

Overview Summary Findings Index Rankings Country Analysis Regional Analysis Download Reports

As the only global index focused specifically on the role of government, it offers a comprehensive view of how public

institutions can enable and govern AI, while recognising the importance of collaboration with the private sector and academia. Used as a benchmark by countries around the world, the Index features in multiple national AI strategies and informs policymaking at the highest levels.

In this year's edition, we assess the AI readiness of 195 governments in an increasingly complex environment marked by rapid innovation, fragmented governance, and expanding AI value chains. To reflect this, we've updated the Government AI Readiness Index methodology and refined our core question: **To what extent can a government harness AI to benefit the public?**

By expanding the scope of the Index, we aim to provide governments with more relevant, actionable insights to navigate the opportunities and challenges of AI.

Regional Context

North America is an AI heavyweight – with the region characterised by deep and dynamic AI and innovation ecosystems, which shape the global AI discourse and direction. The US, home to the global innovation incubator of Silicon Valley, has a concentration of cutting-edge 'frontier' AI labs and other Big Tech firms. The country also has an extensive venture capital funding network, a deep research and academic community, and a government committed to leveraging AI as an instrument of geopolitics. A bit further north, Canada has long been an important AI actor. The country was one of the first to develop a national approach to AI – the Pan-Canadian AI Strategy, launched in 2017 – and continues to invest heavily in AI talent, infrastructure, and ecosystem development.

Overview

As a region, North America once again tops this year's Government AI Readiness Index. With an average score of 81.51, it continues to rank as the most AI-ready region by a significant margin. In 2025, 17 points separate North America from second-place Western Europe. North America's strong performance is particularly driven by the USA – which continues to lead the global ranking with an overall AI readiness score of 88.36. However, neighbouring Canada also performs well – remaining within the top 20 with an AI readiness score of 74.66.

For 2025, North America is the best performing region across all pillars of AI readiness. Its strongest components are Policy Capacity and Public Sector Adoption. The region's leadership is also apparent in the Development and Diffusion pillar – which identifies the maturity of a country's domestic AI sector. North America's strong performance in this pillar is particularly fuelled by strong scores in AI sector maturity and AI technology diffusion. The latter measures how AI is being used in a country – from AI research, to the adoption of AI by local businesses.

Overview Summary Findings Index Rankings Country Analysis Regional Analysis Download Reports

2026 should be an interesting AI year for the region. With the US hosting the G20 summit, AI will no doubt be a key strand of discussions – potentially also in the context of continued geopolitical rivalry between the US, China, and the European Union. Canada will also have a busy year, with the second phase of the Pan-Canadian AI Strategy seeing budgets being spent across the country's National AI Institutes, its global innovation clusters, and to support continued work by the Standards Council of Canada to shape AI standards.
