AI chips for in-house infrastructure

			September 2026
AMD	MI455X / Helios	GPU rack system	Production announced July 2026; HPE announced a Vultr order in September; cloud access not confirmed
Intel	Crescent Island	Data center GPU	Announced; customer sampling targeted for the second half of 2026
Qualcomm	AI200	Inference accelerator	Announced; commercial availability targeted for 2026
Groq	GroqCloud	Inference cloud service	Available through GroqCloud
SambaNova Systems	SN50	Inference accelerator	Announced; customer shipments targeted for the second half of 2026
Cerebras	CS-4 / WSE-3 Turbo	Wafer-scale inference	Announced August 2026 with Q3 shipment target; Gimlet

AI chips for in-house infrastructure

Company	Product	Product type	Availability
d-Matrix	Corsair / SquadRack	Inference server and rack system	Generally available since October 2026; larger Squadron clusters shipping to priority customers
Rebellions	Rebel100 / RebelRack	Inference accelerator and rack system	RebelRack and RebelPOD shipping as of September 2026; Tokyo deployment planned
Tenstorrent	Blackhole p150a	Accelerator card	Available to order
Positron	Archer / Atlas	Inference server	Available to order; company reported 50-plus racks deployed at OCI in September 2026
_etched	A0 silicon	Inference chip prototype	First silicon reported in June 2026
Taalas	HC1	Model-specific inference chip	Technology demonstrator; commercial availability not established

AI chips for in-house infrastructure

Company	Product	Product type	Availability
Vaire	Ice River	Reversible-computing test chip	Test chip demonstrated; no commercial product established
Fractile	Memory-compute processor project	Inference processor project	In development; commercial availability not established
FuriosaAI	RNGD	Inference cards and servers	Volume shipping announced in January 2026
Graphcore	IPU-POD256	IPU compute system	Current commercial availability not established in the cited sources
Mythic	M1076 AMP	Analog inference processor	Current commercial availability not established in the cited sources
Speedata	Analytics Processing	Analytics accelerator	Commercial availability not established in the cited

AI chips for in-house infrastructure

Company	Product	Product type	Availability
		and cards	September 2026
NextSilicon	Maverick-2	Accelerator card and module	Deployed at customer sites
AWS	Trainium3	Cloud AI accelerator	Available through AWS EC2 since December 2025
Google Cloud Platform	Ironwood / TPU7x	Cloud AI accelerator	Generally available through Google Cloud since March 2026
Alibaba	Zhenwu V900	Training and inference accelerator	Announced September 2026; mass production and commercial release targeted for Q1 2027
IBM	Spyre Accelerator	Accelerator card	Available in IBM systems since October 2025
Huawei	Atlas 960E SuperPoD	AI accelerator cluster	Announced September 2026; commercial availability date not disclosed

AIMultiple Premium

AI chips for in-house infrastructure

Company	Product	Product type	Availability
			planned for 2027
Apple	M2 Ultra in AI servers	Server processor	Used in Apple AI servers
Meta	MTIA 300	AI accelerator	Used internally for ranking and recommendation training
OpenAI	Jalapeño	Custom inference chip	Engineering samples; initial deployment targeted for late 2026
Broadcom	Jalapeño with OpenAI	Custom inference chip	Engineering samples; initial OpenAI deployment targeted for late 2026
Marvell	Customer-specific XPUs	Custom AI chips	Supplied to customers under contract
Arm	Arm AGI CPU	Data center CPU	Early systems available; broader availability targeted for the second half of 2026

Each row names a representative product, its type and its ability distinguishes hardware offered for sale, cloud services, internal deployments

AI chips for in-house infrastructure

GPUs vs ASICs in AI chip architectures

GPUs are programmable parallel processors used for training and inference. TPU and Trainium support both workloads, while other designs focus on inference. Architecture alone does not establish performance for a particular model.

AI chips for in-house infrastructure

Microsoft	Maia 300	ASIC (dataflow)	Not disclosed	Yes	Announced (Oct 2026); deployment planned 2027

Training and inference columns describe the stated workload scope. Evidence identifies the basis for each row as Specification, Roadmap claim, Vendor benchmark or Independent benchmark. Independent benchmark applies to the named tested hardware. It does not validate the vendor's other products or future generations.

Data center GPU and accelerator suppliers

1. NVIDIA

NVIDIA designs GPUs and systems for AI training and inference. Its data center products range from individual accelerators to racks that connect GPUs, host CPUs and networking. It outsources chip fabrication to TSMC.

AI chips for in-house infrastructure

NVIDIA unveiled Vera Rubin, its platform after Blackwell Ultra, at CES 2026 as a six-chip platform.[2] At GTC on March 16, 2026 NVIDIA expanded it to seven chips, the Vera CPU, Rubin GPU, NVLink 6 Switch, ConnectX-9 SuperNIC, BlueField-4 DPU, Spectrum-6 Ethernet switch and Groq 3 LPU, and declared them in full production.[3] On September 30, 2026, NVIDIA said CoreWeave was offering Vera Rubin NVL72 to early-access customers, with Cognition running production workloads as the first production customer.[4] Blackwell and the GB300 NVL72 remained the revenue volume product through Q1 FY2027.

The Vera Rubin NVL72 rack pairs 72 Rubin GPUs with 36 Vera CPUs for 3,600 PFLOPS of NVFP4 inference, 20.7 TB of HBM4 and 260 TB/s of NVLink 6 scale-up bandwidth.[5] The Rubin GPU is reported to be built on TSMC's N3P with HBM4, a node NVIDIA has not confirmed.

The seventh chip comes from NVIDIA's December 2025 licensing agreement with Groq, covered in the Groq section below.

The Groq 3 LPU is a dedicated inference chip, and Samsung Foundry manufactures it.[6] Groq 3 LPX racks are slated for the second half of 2026, and NVIDIA projects up to 35x higher throughput per megawatt for trillion-parameter models when LPX is paired with Vera Rubin NVL72.[7]

to hold 70% to 75% of the AI accelerator market through 2030.[9]

NVIDIA Dynamo, announced at GTC 2025, is an open-source inference framework for high-throughput, low-latency deployment of generative AI models in distributed environments.[10]

NVIDIA also offers DGX Cloud services. Its DGX Cloud Lepton marketplace connects developers with GPU cloud providers including CoreWeave, Lambda and Crusoe.[11]

Desktop and enterprise systems

DGX Spark (formerly Project Digits) is a desktop AI supercomputer featuring a Grace Blackwell Superchip with an NVIDIA Blackwell RTX GPU with 6,144 CUDA cores and fifth-generation Tensor Cores with FP4 precision, connected via the NVIDIA NVLink-C2C chip-to-chip interconnect to a 20-core NVIDIA Grace CPU, with up to 1 petaflop of AI compute and 128GB of unified memory.[12][13]

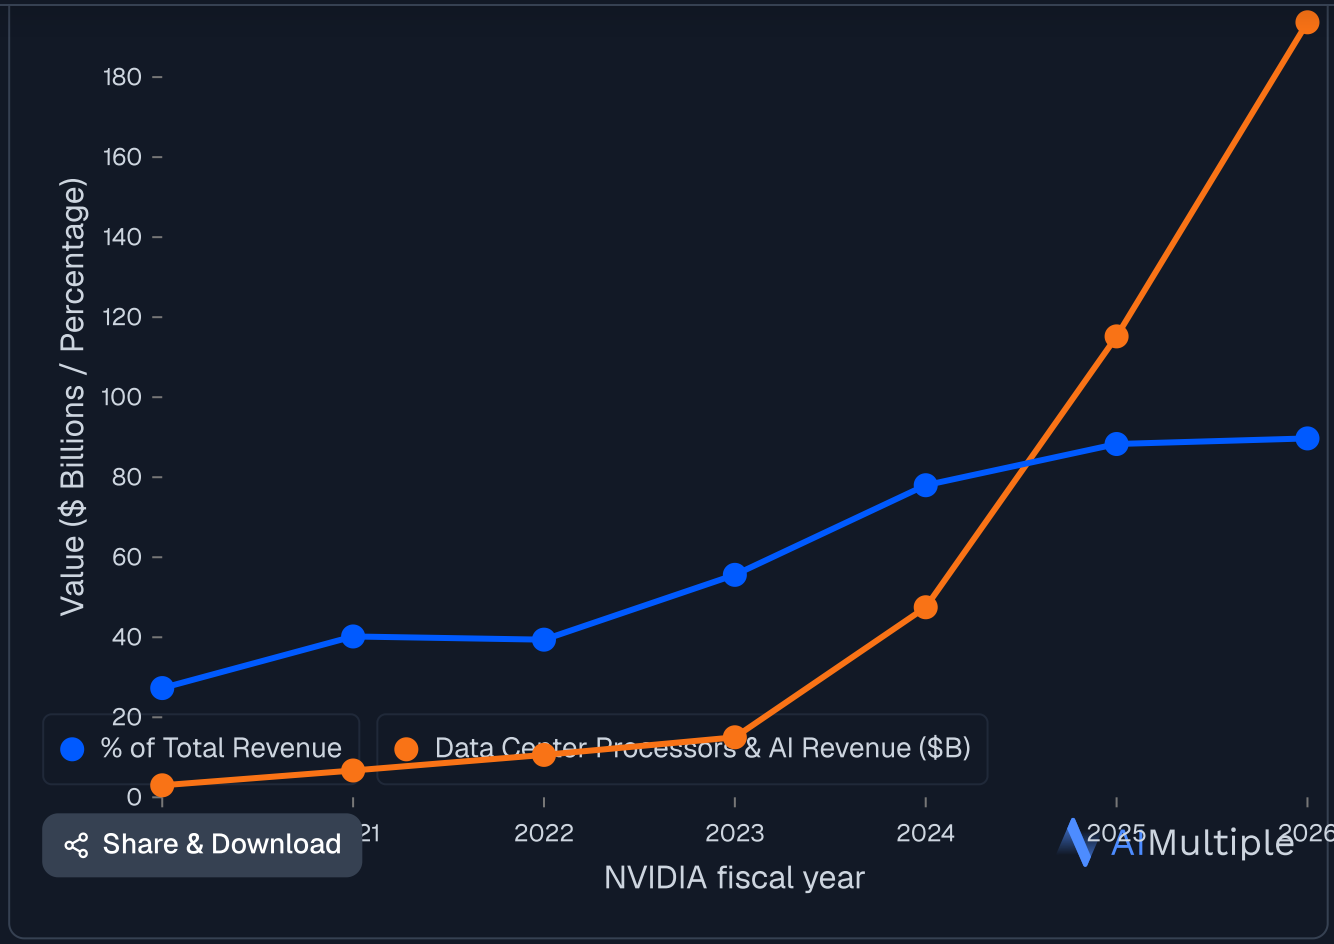

Announced in May 2025 at Computex, NVIDIA introduced RTX PRO Servers powered by RTX PRO 6000 Blackwell Server Edition GPUs, designed for enterprise AI factories.[14]

Data center revenue

AIMultiple

Premium

AI chips for in-house infrastructure

NVIDIA data center revenue and its share of total revenue are reported by NVIDIA fiscal year.[15]

3. AMD

AI chips for in-house infrastructure

with NVIDIA for market share. Startups, enterprises and tech giants adopted AMD hardware in 2023, when NVIDIA hardware was difficult to procure amid the generative AI boom triggered by the launch of ChatGPT.[1,6,17,18]

In 2025, AMD acquired a team of AI hardware and software engineers from Untether AI along with compiler startup Brium. In June 2026 AMD announced the acquisition of MEXT, whose predictive-memory technology is designed to make flash behave more like DRAM and cut data center memory cost.[19,20] AMD also agreed to acquire Taalas in August 2026, as covered in the Taalas profile below.[21]

AMD launched the Instinct MI350X and MI355X on June 12, 2025 at Advancing AI 2025.[22] The MI355X is built on CDNA4 at TSMC 3nm with 288 GB of HBM3E and 10.1 PFLOPS of MXFP4, and AMD positions it against NVIDIA's Blackwell B200. AMD followed on May 7, 2026 with the Instinct MI350P, a passive PCIe 5.0 card carrying 144 GB of HBM3E and a 600 W maximum TBP.[23]

AMD announced an OpenAI agreement on October 6, 2025 covering 6 GW, with the first 1 GW of MI450 Series capacity from the second half of 2026.[24]

AMD named Oracle Cloud Infrastructure as a launch partner on October 14, 2025 for an initial 50,000 MI450 Series GPUs from calendar Q3 2026.[25]

AMD announced a Meta agreement on February 24, 2026 for [illegible] from the second half of 2026, using a custom Instinct GPU based on the

AI chips for in-house infrastructure

MI450 Series GPUs in Helios racks from the first half of 2027.[28]

For measured inference comparisons across NVIDIA and AMD GPUs, see our **GPU concurrency benchmark**.

MI400 series

AMD launched the Instinct MI400 Series at Advancing AI 2026 on July 22-23, 2026.[29] The MI455X is the AI-focused member of the family. AMD lists it as CDNA5 on “TSMC 2nm | 3nm FinFET” with 320 billion transistors, 432 GB of HBM4, 23.3 TB/s of peak memory bandwidth and 40.3 PFLOPS of OCP MXFP4.[30] AMD said in July that Helios, its MI400 Series rack system, was in full production and targeted initial shipments for the end of Q3 2026.[29] On September 30, HPE announced a $1.2 billion Vultr order for Helios racks, each with 72 MI455X GPUs. The announcement described planned deployment at Vultr’s US data centers.[31]

A third family member, the MI440X, was introduced at CES 2026 on January 5, 2026 for on-premises enterprise AI in a compact, eight-GPU form factor, and AMD has published no specifications for it since.[32] Further out, AMD’s roadmap places the Instinct MI500 Series in 2027 and the MI600 Series in 2028, with

the CDNA 6 architecture, 2nm process technology and HB etail for MI500 given at CES 2026.[29]

AI chips for in-house infrastructure

19.6 TB/s, and updated its specifications on July 23, 2026. AMD's product page now lists up to 288 TFLOPS of hardware-based peak theoretical FP64, up to 9.2 PFLOPS of peak FP4 and MXFP4, 432 GB of integrated HBM4 and up to 23.3 TB/s of peak theoretical memory bandwidth.[33] Full-rate FP64 support distinguishes it from the MI455X for scientific computing.

AMD expects the MI430X to be available in 2027 and has published no transistor count, board power or lithography for it. Two figures in AMD's own materials disagree. The MI400-series landing-page FAQ still states up to 19.6 TB/s where the MI430X specification page gives 23.3 TB/s, and the FAQ on the MI430X page contains a typo reading 2.3 TB/s.[33]

AMD names three target systems for the MI430X: Discovery at Oak Ridge National Laboratory, planned for 2028. Another target is Alice Recoque, France's first exascale system. AMD also names Herder at HLRS Stuttgart, announced with HPE on December 2, 2025. Lux, the Oak Ridge AI factory cluster announced on October 27, 2025, is built on MI355X and is not an MI430X system.

Software

AMD's AI software runs on the ROCm stack. SemiAnalysis's [illegible] 22, 2024 benchmark of MI300X against H100 and H200, gave AMD a 0% chance of

AI chips for in-house infrastructure

The same analysts have since revised that call, on July 25, 2026, to "a great chance of success as long as AMD solves the two major risks we outline below": the Helios rack production ramp, where weak SerDes require up to 85% of the backplane to be retimed with over 550 Broadcom ethernet retimers per rack, and a persistent lack of stable internal GPU clusters for software development and automated-testing CI.[35]

At Advancing AI 2026 AMD committed to a fixed six-week feature-release cadence in place of its previous roughly quarterly cycle.[36]

Ecosystem

Like NVIDIA, AMD is selectively investing in users of its solutions to drive adoption of its hardware.[37] It has also tied equity to its largest commitments, issuing OpenAI and Meta each a performance-based warrant for up to 160 million shares at $0.01, vesting against Instinct shipment milestones.[38]

3. Intel

Intel has a long history of semiconductor development. Intel owns fabs and builds parts such as the 18A-based Xeon 6+ in-house. It also sources AI-related

components from TSMC, and Gaudi 3 itself was manufactured on a 5nm process.[39]

AI chips for in-house infrastructure

is a GPU.[40] The chip itself has not been withdrawn. Intel's product page still lists the Gaudi 3 PCIe card (HL-338) as shipping, and Intel has published no end-of-life notice for it.[41] Intel targeted $500 million in Gaudi revenue for 2024 and abandoned the target on its third-quarter earnings call on October 31, 2024. At CES 2026 it conceded that Gaudi "did not meet the needs of the frontier AI training market."[40]

Intel cancelled its Falcon Shores GPU to pivot to Jaguar Shores, a rack-scale AI accelerator whose confirmed details are limited to the Gaudi branding and SK hynix HBM4 memory, with no process node stated.[40] At CES 2026 Intel's roadmap referred to "the Shores product line" without the Jaguar name, and Intel has not announced a rename. Intel made fresh AI hardware announcements at Computex 2026 including its Xeon 6+ processor on the 18A node.[42][43]

Crescent Island is a Xe3P-based, inference-optimized data center GPU, first announced on October 14, 2025 at the OCP Global Summit with 160GB of LPDDR5X and customer sampling expected in the second half of 2026.[44] Intel detailed it at Computex 2026 as a 350W air-cooled PCIe card supporting data types from FP4 through FP64, with a maximum partner configuration of 480GB. The announced card has 160GB.[40]

Qualcomm brands one letter apart sit either side of that line. Dragonwing, introduced on February 25, 2025, covers industrial and embedded IoT, networking and cellular infrastructure and carries the company's edge AI parts, while Dragonfly, launched on June 24, 2026, is the data center brand.[45]

AI200, AI250 and the data center roadmap

On October 27, 2025, Qualcomm announced the AI200 and AI250, two rack-scale AI inference solutions. Both now sit under the Dragonfly brand Qualcomm launched in June 2026.[46] The AI200 supports 768 GB of LPDDR per card, and Qualcomm said at announcement that the AI200 and AI250 were expected to be commercially available in 2026 and 2027 respectively.

The AI250 introduces a near-memory computing architecture that Qualcomm says delivers 133 TB/s of effective memory bandwidth per card, 18 times the AI200. This is a vendor roadmap specification. Both racks use direct liquid cooling, and Qualcomm now specifies a 140 kW OCP ORv3-compliant rack.[47]

On June 24, 2026, Qualcomm unveiled three further data center products.[47] The Dragonfly C1000 is a data center CPU expected to reach commercial availability in 2028, and Qualcomm named Meta as its customer under a multi-generation collaboration covering data center CPUs. Qualcomm High Bandwidth Compute

(HBC) bonds compute with accelerated memory bandwidth [illegible] d
silicon solution, making it a compute architecture, and HBC Gen 1, paired with

AI chips for in-house infrastructure

fiscal 2029.[48]

On September 8, 2026, Qualcomm announced a multi-generation collaboration with Amazon on custom silicon for AI inference and optical connectivity up to 1.6T.[49]

Acquisitions and the Cloud AI 100 family

Qualcomm completed its acquisition of Alphawave on December 18, 2025. Qualcomm completed its acquisition of Modular on July 29, 2026. Mojo, MAX and Modular Cloud continue as products and brands.[50]

Before the Dragonfly line, Qualcomm's data center inference accelerators were the Cloud AI 100 cards. The Cloud AI 100 Pro PCIe card draws 75 W and is rated at up to 400 TOPS INT8 and up to 200 TFLOPS FP16.

Specialist AI accelerators and inference providers

5. Groq

Groq was founded by former Google employees and built i nd the LPU (Language Processing Unit), a chip architecture designed for low-

AI chips for in-house infrastructure

licensing agreement with NVIDIA covering Groq's inference technology, and that founder and CEO Jonathan Ross, president Sunny Madra and other senior team members had joined NVIDIA.[51] Groq stated that it continues as an independent company. CNBC put the transaction at a reported ~$20 billion in cash, which would make it NVIDIA's largest to date, a figure attributed to Alex Davis, CEO of Groq investor Disruptive, who also said NVIDIA acquires all of Groq's assets except the GroqCloud business.[52] NVIDIA has published no press release on the deal, NVIDIA CFO Colette Kress declined to comment on the price, and Reuters noted that neither company confirmed it. Jensen Huang told employees, "While we are adding talented employees to our ranks and licensing Groq's IP, we are not acquiring Groq as a company." NVIDIA unveiled the resulting product, the NVIDIA Groq 3 LPU, at GTC on March 16, 2026 as the seventh chip of the Vera Rubin platform.[7]

Groq operates an inference cloud and is an NVIDIA Cloud Partner. In August 2026 it reported 13 data centers, more than six million developers and 54 MW of capacity, with a target above 200 MW in 2027.[53] Its Dammam data center, built with Aramco Digital, sits behind a $1.5 billion Saudi investment commitment announced in February 2025.[54]

On August 17, 2026, Groq LLC announced a $350 million Series A at a $3.5 billion valuation, led by Disruptive with planned participation from NVIDIA. The

release calls the June and August rounds $1 billion of rece[illegible]e stating that the Series A remains subject to customary closing conditions.[53]

AI chips for in-house infrastructure

SambaNova develops Reconfigurable Data Units (RDUs) and offers inference through SambaCloud. It completed the first close of a $1 billion Series F at an $11 billion valuation on July 8, 2026.[55]

SambaNova unveiled the SN50, its latest Reconfigurable Data Unit (RDU), on February 24, 2026, with shipments to customers due in the second half of 2026. SambaNova specifies 5x more compute per accelerator and 4x more network bandwidth than the previous generation SN40L, and supports a three-tier memory architecture for models up to 10 trillion parameters and context up to 10 million tokens.[56] SoftBank Corp. will be the first customer to deploy SN50 within its AI data centers in Japan.

SambaNova also announced a planned multi-year strategic collaboration with Intel to deliver AI inference solutions.

SambaNova Systems leases its platform to businesses through SambaCloud.[57]

7. Cerebras

Cerebras builds wafer-scale accelerators. Its WSE-3 integrates four trillion transistors and 900,000 AI cores on a single wafer-scale processor.[58]

Cerebras introduced the CS-4 inference system on August [illegible] combines three WSE-3 Turbo processors and supports disaggregated inference, with

AI chips for in-house infrastructure

[illegible] launch partner on September 25 and said the first Cerebras-powered Gimlet Cloud data center was expected later in 2026.[60]

Cerebras' system works with pharmaceutical companies such as AstraZeneca and GlaxoSmithKline and research labs that rely on it for simulations. It also targets LLM makers since its chips can lower inference costs for frontier models.

Cerebras also offers its chips on its cloud to enterprises. On September 1, 2026, it announced a Finnish data center project with Compute Nordic Finland, scaling in phases to 165 MW of contracted IT capacity. Construction of the initial 50 MW phase was under way.[61]

Cerebras has traded on Nasdaq under the ticker CBRS since May 14, 2026, after an IPO that raised about $6.38 billion in gross proceeds.[62] In its August 12 Q2 results, Cerebras raised its FY2026 core revenue forecast to $880-890 million.[63] It signed a 750 MW inference agreement with OpenAI on January 14, 2026 that its own Q1 release values at more than $20 billion.[64]

8. d-Matrix

d-Matrix develops inference accelerators that place compute near SRAM to reduce data movement.[65]

Corsair uses an SRAM-based in-memory compute chiplet [illegible] On October 12, 2026, d-Matrix announced general availability of Corsair servers and Corsair XPUs.

Gimlet Labs tested gpt-oss-120b with a 1.6-billion-parameter speculative decoder offloaded to Corsair. It reported a 2-5x end-to-end speedup for interactive configurations and up to 10x for configurations optimized for energy use, compared with the same decoder on a GPU at equivalent energy consumption. Gimlet is a commercial partner of d-Matrix, and d-Matrix's co-founder and CTO co-authored the benchmark post.[67]

9. Rebellions

Rebellions is a Korea-based startup focused on LLM inference. It merged with another Korean semiconductor design firm, SAPEON.[68] Total funding is about $850 million.[69] The IPO has not happened. Rebellions said on July 8, 2026 that it targets the first or second quarter of 2027, leaning toward a KOSPI main-board listing.[70]

REBEL-Quad is the second-generation accelerator, four chiplets built on Samsung's 4nm process, and Rebel100 is its productized commercial name.

Rebellions confirmed on September 15, 2026 that RebelRack and RebelPOD systems were shipping. Its partnership with ai& included an initial purchase for a

planned Tokyo deployment. Operation at the Japanese site ... to begin after delivery.[71]

AI chips for in-house infrastructure

Tenstorrent's latest Blackhole Tensix Processor delivers 664 TFLOPS (BLOCKFP8) of performance, paired with 32GB of GDDR6 memory and 512 GB/s memory bandwidth.

The P150a card is priced at $1,399 and features four QSFP-DD 800G ports for multi-card scaling. The entry-level P100a model starts at $999.[72]

From January 2026, Blackhole p150 cards ship with 120 active Tensix cores, reduced from 140, and firmware release v19.5.0 applied the same reduction retroactively to cards sold. Tenstorrent puts the cost at 1-2% on typical workloads.[73]

Tenstorrent offers a fully open-source software stack. The company raised $700 million in December 2024.[74]

11. Positron

Positron designs hardware and software for transformer inference. Atlas is its shipping server. Asimov and Titan are its planned chip and system products.[75]

Products:

- **Atlas** (shipping now): A transformer inference server fea on Archer Transformer Accelerators with 256 GB total HBM. The company claims

- **Titan** (planned): A successor inference system combining four to eight Asimov chips. Positron's September 2026 announcement described configurations using LPDDR5X memory.[75]
- **Asimov** (planned): Custom inference silicon scheduled for tape-out on TSMC N3P at the end of 2026, with production targeted for the second half of 2027. Positron specifies 288-2,304 GB of memory per chip.[75]

Positron announced $875 million of Series C financing on September 10, 2026 at a $5 billion post-money valuation. This comprised a $375 million Series C tranche and up to $500 million in a Series C-1 tranche. The company also reported an Atlas deployment of more than 50 racks at Oracle Cloud Infrastructure.[75]

12. _etched

Their approach sacrifices flexibility for efficiency by burning model architectures into their chips.

Etched emerged from stealth on June 30, 2026 with first-pass A0 silicon back from TSMC's N4P process, more than $1 billion in signed customer contracts and $800 million raised.[77] On July 23, 2026 it announced a $300 million Series C at a $10.3 billion valuation, led by Sequoia.[78]

The company no longer uses the Sohu product name. It no[illegible]lf as building frontier inference clusters that run DeepSeek, Qwen, Mamba and Llama,

AI chips for in-house infrastructure

names no customer behind the contracts it reports, so its performance figures remain internal measurements. The obsolescence question the original Sohu design raised now applies to the wider model set, since a chip built around a fixed group of architectures has to be re-targeted once those architectures are superseded.

13. Taalas

Taalas was founded in early 2023 and hard-wires individual models directly into custom silicon, producing what the company calls “Hardcore Models.”[79] The company claims it can transform any previously unseen AI model into custom silicon within two months. AMD announced an agreement to acquire Taalas on August 6, 2026, subject to closing conditions and regulatory approvals. AMD plans to integrate its technology into systems alongside Instinct GPUs.[21]

Taalas’ architecture unifies storage and compute on a single chip at DRAM-level density, eliminating the need for HBM, advanced packaging, 3D stacking, liquid cooling, or high-speed I/O.

Products:

- **HC1** (available now): A technology demonstrator hard-wired for Llama 3.1 8B, built on TSMC 6nm with 53 billion transistors. Taalas claims 17,000 tokens per second per user and says it has not observed quality degradations compared to GPU baselines.
- **HC2** (roadmap target for winter 2026, not yet a product): A second-generation platform with higher density, faster execution, and standard 4-bit floating-point formats to address the quantization limitations of HC1.

14. Extropic

Extropic raised a $14 million round in late 2023 to use thermodynamics for computing. Its hardware page lists three parts. X0 is a silicon prototype from Q1 2025, and XTR-0 is a development platform shipped in limited numbers to selected researchers in Q3 2025. Both were unveiled on October 29, 2025. Z1, the first production-scale chip, is listed as early access in 2026.[81]

15. Vaire

Vaire develops reversible computing circuits that recover some switching energy for reuse. Its published results concern test circuits.

Vaire's first test chip, codenamed Ice River, is a 22nm CMOS demonstrator. Measurements reported in September 2025 gave an energy-recovery factor of 1.77 for a capacitor array driven by Vaire's resonator and 1.41 for a shift register on the same chip, against roughly 2x predicted in simulation.[82] The 50%

figure reported at tape-out applies to the resonator alone ther energy overheads.[83][84]

AI chips for in-house infrastructure

Fractile develops AI inference processors that interleave memory and compute on the same die.[85]

Fractile claims its design can run frontier models up to 25 times faster than GPUs. The comparison is a vendor claim. A shipping product is not established here.

Fractile announced a $220 million Series B on May 13, 2026.[86] Reporting on the round put the valuation at about $1 billion, a figure the company has not confirmed.

17. FuriosaAI

FuriosaAI develops RNGD, a data center accelerator for AI inference. It announced volume availability on January 27, 2026, as a PCIe card and in its eight-card NXT RNGD server. The card has a stated 180 W TDP.[87]

Its SDK supports model compilation, multi-chip execution and an OpenAI-compatible API. FuriosaAI reports volume availability and publishes its own GPU performance comparisons.[87]

SoftBank injected a further $457 million into Graphcore on April 10, 2026.[89]

19. Mythic

Mythic was founded in 2012 and is focused on edge AI. Mythic follows an unconventional path, an analog compute architecture, that aims to deliver power-efficient edge AI computing.

Mythic developed the M1076 Analog Matrix Processor and the MM1076 card.[90]

Mythic raised an oversubscribed $125 million round led by DCVC on December 17, 2025.[91] It acquired Videantis on May 19, 2026.[92]

20. Speedata

Founded in 2019 in Tel Aviv, Speedata develops an Analytics Processing Unit (APU) designed to accelerate big data analytics and AI workloads. It's an APU that targets Apache Spark workloads, with plans to support other major data analytics platforms.

Speedata raised $44 million in a Series B round in June 2025, led by Walden Catalyst Ventures, 83North, and others, bringing its total funding to

Founded in July 2021 in Eindhoven, Netherlands, Axelera AI specializes in AI hardware acceleration technology for computer vision and generative AI. The company is developing Titania, an AI inference chiplet based on its Digital In-Memory Computing (D-IMC) architecture, designed to accelerate AI workloads from edge to cloud.

Axelera AI raised more than $250 million on February 24, 2026, taking its total to more than $450 million in equity, grants and venture debt.[94][95]

Axelera launched Europa on September 15, 2026 and states that it is shipping as a chip and in Edge 232p and Server 250p PCIe cards. It also lists validated Edge 232p systems from Dell and Supermicro.[96] Titania remains targeted for 2028.

22. NextSilicon

NextSilicon, founded in Tel Aviv in 2017, sells Maverick-2, a runtime-reconfigurable dataflow accelerator built on TSMC's 5nm process and shipped as a PCIe Gen 5 card with 96 GB of HBM3E or as an OAM module with 192 GB.[97] The company says Maverick-2 is deployed at dozens of customer sites. One named site is Sandia National Laboratories' Spectra, a 64-node system with 128 dual-die Maverick-2 accelerators that passed full system acceptance under

Sandia's Vanguard program in May 2026 after running HP[illegible]d SPARTA.[9899] NextSilicon claims 10x GPU performance at half the power.

AI chips for in-house infrastructure

[illegible] targeting 3.4 GHz and expected in the first quarter of 2028.[100]

Cloud platforms and integrated AI systems

23. AWS

AWS produces Trainium chips for model training and Inferentia chips for inference. It began developing its own chips after Google.

Trainium2 chips form the Project Rainier cluster, which powers **LLM developer** Anthropic's models. The count at the cluster's October 2025 launch was nearly half a million chips, and Anthropic stated on April 20, 2026 that it uses over one million Trainium2 chips.[101]

Trainium3 and Trn3 UltraServers reached general availability on December 2, 2025.[102] Trainium3 is AWS's fourth-generation AI chip and its first built on a 3nm process, rated at 2.52 PFLOPS of FP8 compute, 144 GB of HBM3e and 4.9 TB/s of memory bandwidth per chip. A Trn3 UltraServer scales to 144 chips for 362 FP8 PFLOPS, 20.7 TB of HBM3e and 706 TB/s of memory bandwidth.

AWS announced Trainium4 as a roadmap item at re:Invent [illegible] port for NVIDIA NVLink Fusion. On the Q1 2026 earnings call, Amazon said Trainium4

AI chips for in-house infrastructure

24. Google Cloud Platform

Google Cloud TPU is the purpose-built machine learning accelerator chip that powers Google products. Google announced TPUs in 2016.[104] Trillium TPU is the 6th generation.[105]

Ironwood, also called TPU v7 or TPU7x, is designed for complex “thinking models” like LLMs and MoEs, with 4,614 TFLOPS of FP8 compute per chip and up to 42.5 Exaflops in 9,216-chip pods.[106] It offers 2x the power efficiency of Trillium. Each chip carries 192 GB of High Bandwidth Memory at 7.37 TB/s, with 1.2 TB/s bidirectional (9.6 Tb/s) Inter-Chip Interconnect and an enhanced SparseCore for large embeddings.[107] It entered preview on November 24, 2025 and reached general availability on March 31, 2026.[108]

At Cloud Next on April 22, 2026, Google announced its eighth TPU generation as two purpose-built chips, TPU 8t for training and TPU 8i for inference.[109] A TPU 8t superpod scales to 9,600 chips, two petabytes of shared HBM and 121 ExaFLOPS at FP4. Google says both will be available later in 2026.

25. Alibaba

Alibaba designs AI accelerators through its chip unit T-Hea[illegible]on a self-developed parallel processing unit (PPU) architecture with a custom

AI chips for in-house infrastructure

96 GB of HBM2e and 700 GB/s of inter-chip bandwidth across 7 independent ICN links, performance the company describes as comparable to NVIDIA's H20, and Alibaba Cloud deploys it in 10,000-card clusters. The announcement disclosed specifications for the existing chip. The 810E silicon and the 10,000-card deployments predate that announcement.

On May 19-20, 2026, Alibaba announced the Zhenwu M890, with 144 GB of memory, 800 GB/s of inter-chip interconnect bandwidth, native support from FP32 down to FP4, and three times the performance of the 810E. It ships inside the Panjiu AL128 supernode, which holds 128 accelerators per rack and uses the ICN Switch 1.0 at 25.6 Tbps. Alibaba states that cumulative deliveries of the Zhenwu series exceed 560,000 units. That cumulative figure includes earlier Zhenwu generations.

At its September 2026 Apsara conference, Alibaba announced the Zhenwu V900 for training and inference. It specifies 216 GB of memory, 1,200 GB/s of inter-chip bandwidth and native FP8/FP4 support. Alibaba targets mass production and commercial release for Q1 2027.[111]

Some North American, European, and Australian organizations (e.g., those in the defense industry) may not prefer to use Alibaba Cloud for geopolitical reasons.

processing capabilities of IBM Z mainframe servers. IBM also demonstrated that merging compute and memory can lead to efficiencies in the North Pole processor prototype.[114]

The IBM AI accelerator that ships commercially is the Spyre Accelerator, announced on October 7, 2025 and available from October 28, 2025 on z17 and LinuxONE 5, and from early December 2025 on Power11.[115] Spyre carries 32 accelerator cores and 25.6 billion transistors on a 5nm process, packaged as a 75W PCIe card with 128 GB of LPDDR5. Up to 48 cards cluster in a Z or LinuxONE system, against 16 in Power.

27. Huawei

Huawei's HiSilicon Ascend 910C is part of the Ascend 910 family of chips introduced in 2019.

AI labs in China are experimenting with the Ascend 910C. Huawei's cloud is hosting DeepSeek models, and a researcher at DeepSeek claims that it can reach 60% of NVIDIA H100 inference performance.[116]

Huawei debuted the Ascend 950PR chip alongside the Atlas 350 accelerator card on March 20, 2026.[117] The Atlas 350 card is specified at 1.56 PFLOPS of FP4 compute, 112 GB of Huawei's proprietary HiBL 1.0 HBM at 1.4 TB/s of

memory bandwidth, 600 W of power and 2 TB/s of interco emory
figures belong to the card. The Ascend 950PR silicon itself is specified at 128 GB

AI chips for in-house infrastructure

Huawei's September 2025 roadmap listed Ascend 950PR for Q1 2026, 950DT for Q4 2026, Ascend 960 for Q4 2027 and Ascend 970 for Q4 2028.[118] Huawei unveiled the Atlas 960E SuperPoD on September 17, 2026, connecting up to 4,096 NPUs through UnifiedBus and Hi-ONE near-packaged optics. Huawei specifies 8 EFLOPS at FP8 and 16 EFLOPS at FP4 for a single SuperPoD. The announcement did not give a commercial availability date.[119]

28. Microsoft Azure

At Hot Chips 2024, Microsoft unveiled Maia 100, their first custom AI accelerator, built on TSMC's N5 process. Microsoft launched Maia 200 (codenamed Braga) on January 26, 2026, as an inference-focused AI accelerator for Azure, designed to reduce AI token costs and deliver 30% better performance per dollar over existing systems.[120]

Maia 200 is built on TSMC 3nm with more than 140 billion transistors, 216 GB of HBM3e at 7 TB/s, 272 MB of on-chip SRAM and more than 10 PFLOPS of FP4 compute within a 750 W SoC TDP. Microsoft confirmed Maia 200 was live in its Iowa and Arizona data centers on its FY2026 Q3 earnings call.[121]

Microsoft announced Maia 300 on October 12, 2026, with deployment scheduled to begin in 2027. The inference accelerator uses TSMC

AI chips for in-house infrastructure

rack design connects 36 accelerators. Microsoft also said Maia 200 was serving Copilot production traffic across deployments in the US, Europe and Australia.[123]

AI chips for in-house infrastructure

29. Apple

Apple's Project ACDC is reported to be focused on building chips for AI inference in data centers.[124] The server chip is reportedly codenamed Baltra and developed with Broadcom, and Apple has never officially acknowledged it. Reuters reported on July 15, 2026, citing The Information, that the project has been pushed back and that Apple's in-house AI servers still run on M2 Ultra chips.[125][126] M5 launched on October 15, 2025, and M5 Pro and M5 Max were announced on March 3, 2026 with a Neural Accelerator in each GPU core. Apple is strengthening its on-device AI strategy with the Core AI framework, which runs models on Apple silicon with no server dependencies, supported by an open-source Core AI models repository on GitHub.[127][128]

30. Meta

Meta Training and Inference Accelerator (MTIA) is a family r AI workloads such as training Meta's Llama models.

AI chips for in-house infrastructure

technology, is claimed to offer 3x the performance of MTIA v1, and is hosted in racks containing up to 72 accelerators.[129] MTIA 300 is in production for ranking and recommendation training, and MTIA 400, 450 and 500 follow across 2026 and 2027.[130]

MTIA runs Meta's internal workloads and is not offered as a public cloud accelerator.

Broadcom co-designs technology for Meta's MTIA program. The partnership and capacity commitments are covered in the **Broadcom profile**.[131]

31. OpenAI

OpenAI designed its first AI chip with Broadcom, and the leadership of its chip team has experience designing TPUs at Google.[132] OpenAI has confirmed TSMC as the foundry, but neither OpenAI nor Broadcom has confirmed a process node.[133] Korean supply-chain reporting has used the codename "Titan" for the chip and placed it on TSMC's N3 process, though neither company uses that name.[134]

Samsung has secured an agreement to supply HBM4 memory for the OpenAI chip, reportedly allocating over 50% of its Pyeongtaek foundry capacity to

HBM4 base dies for this purpose.[135] OpenAI and Broadcom a
collaboration for 10 gigawatts of custom AI accelerators in October 2025. Racks

AI chips for in-house infrastructure

undisclosed.[132] On June 24, 2026 the two unveiled Jalapeño, OpenAI's first Intelligence Processor. Both companies state that engineering samples are running ML workloads in the lab at production target frequency and power, including GPT-5.3-Codex-Spark, and that the platform is designed for initial deployment by the end of 2026, which places the chip at the post-tape-out engineering-sample stage.[136] Broadcom's side of the arrangement, including its other custom-accelerator customers, is covered in the Broadcom section below.

Custom AI ASIC design partners

32. Broadcom

Broadcom co-designs custom AI accelerators with customers and supplies the networking that connects them. These customer-specific chips are not sold as a branded merchant accelerator.

Broadcom reported $16.7 billion in AI semiconductor revenue for Q3 FY2026 on September 2, 2026, up 221% year over year. It forecast $21.7 billion for Q4.[137]

On the June 3 call Broadcom walked through six core AI customers but named four of them, Google, Anthropic, OpenAI and Meta. The other two remain

undisclosed and were described as two customers with $[illegible] ase orders received to date, with shipments beginning in late 2026 and accelerating

AI chips for in-house infrastructure

Broadcom's disclosure varies by customer:

- Google has a multi-generation TPU and AI-networking agreement, with no gigawatt figure given. Broadcom's Form 8-K discloses a Long Term Agreement to develop and supply custom TPUs for Google's future generations, plus a Supply Assurance Agreement covering networking components through up to 2031.[139]
- Anthropic takes over 1 GW of TPU-based compute in 2026, plus an April agreement for a further 5 GW of compute beginning in 2027. The same Form 8-K puts the figure at approximately 3.5 gigawatts from 2027, consumption of which it ties to Anthropic's continued commercial success. The 3.5 GW figure comes from Broadcom's filing, while Anthropic's own post quantifies the commitment as "multiple gigawatts". The filing describes the arrangement as an expansion of an existing collaboration.[139]
- For OpenAI, silicon has been delivered, production is expected in late 2026, and OpenAI is contracted for 1.3 GW in 2027 within the larger 10 GW-by-2029 arrangement. The chip itself is covered in the OpenAI section above.[138]
- Meta has a multi-generation MTIA XPU partnership targeting 3 GW through the end of 2028, with an initial 1 GW order delivering from the second half of 2027. Hock Tan is transitioning off Meta's board to an advisor role.[138][131]

On February 26, 2026 Broadcom began shipping a 2nm custom SoC, built on its 3.5D eXtreme Dimension System in Package (XDSiP) platform. That

AI chips for in-house infrastructure

networking, Broadcom said in March 2026 that Tomahawk 6 is the sole 102.4T switch shipping in production volume, and Jericho 4, a 51.2 Tbps fabric router launched in August 2025, is shipping.

On June 9, 2026 Broadcom announced the AI XPV Platform with Apollo and Blackstone as initial anchor investors. The Platform is designed to enable more than 20 gigawatts of compute capacity through 2028, using Broadcom XPUs and networking customized for frontier AI labs including Anthropic and OpenAI. It launched with an initial tranche of $35 billion, funding Anthropic's previously announced expansion of more than 1 gigawatt in Fluidstack-based sites from mid-2026. The more than 20 gigawatts is the Platform's design target through 2028 and is not funded by that tranche.[141]

Third-party estimates of the custom-ASIC share of the AI processor market depend on what is being counted. Bloomberg Intelligence splits the custom-ASIC market between Broadcom at 60% to 80% and Marvell at 20% to 25%.

33. Marvell

Marvell designs custom AI silicon, which it calls XPUs, for hyperscalers, alongside the interconnect, optics and networking silicon that connects those chips. Bloomberg Intelligence puts it second to Broadcom in the custom AI ASIC market.

For Q2 FY2027, reported on August 27, 2026, Marvell post[illegible] in total revenue and $2.172 billion in data center revenue. Data center revenue

AI chips for in-house infrastructure

On March 31, 2026, NVIDIA and Marvell announced a strategic partnership that connects Marvell to the NVIDIA AI factory and AI-RAN ecosystem through NVLink Fusion, together with collaboration on silicon photonics. NVIDIA invested $2 billion in Marvell as part of it. Under the partnership, Marvell provides custom XPUs and NVLink Fusion-compatible scale-up networking.[143]

Marvell closed three acquisitions between February and April 2026, all on the optical and interconnect layer:

- **Celestial AI**, completed on February 2, 2026 at $3.25 billion.[144]
- **XConn Technologies**, completed on February 10, 2026 at approximately $540 million.
- **Polariton Technologies**, a Swiss ETH Zurich spinoff working on plasmonics-based silicon photonics, acquired on April 22, 2026 on undisclosed terms.

Marvell's role in later Trainium generations is disputed. SemiAnalysis reported that Alchip handled Trainium3 back-end physical and package design after Marvell worked on Trainium2.[145] The companies have not confirmed that account.

Host CPUs and processor IP

Host CPUs run alongside accelerators and handle system control and general-purpose work. Arm licenses processor IP and has added its own data center CPU product line.

34. Arm

Arm announced on March 24, 2026 that it is “extending into production silicon products for the first time in the company’s history,” starting with the Arm AGI CPU, a data center CPU for agentic AI infrastructure. Meta “serves as the lead partner and co-developer.”[146][147]

Arm states the CPU carries up to 136 Arm Neoverse V3 cores, 6 GB/s of memory bandwidth per core at sub-100ns latency and a 300 W TDP, scaling to 8,160 cores per air-cooled rack and more than 45,000 cores per liquid-cooled rack. Arm claims more than 2x performance per rack versus x86. These are Arm’s own figures and have not been independently measured.[146]

Arm continues to license IP and Compute Subsystems (CSS) alongside its AGI CPU silicon product line. Early systems are available now, with broader

availability expected in the second half of 2026, and along
names Cerebras, Cloudflare, F5, OpenAI, Positron, Rebellions, SAP and SK

*These are the maximum values quoted by each vendor, and they are not directly comparable across rows. A figure quoted at FP4 or INT4 describes a different operation from one quoted at INT8, and rows marked sparse are vendor figures that assume sparsity. TOPS is tera operations per second, TFLOPS is tera floating-point operations per second, and GOPS is giga operations per second.

Microchip Technology completed its acquisition of Hailo on September 21, 2026, on undisclosed financial terms. Microchip said it would continue supporting Hailo's existing products.[160]

Foundry partners and TSMC's role

TSMC is a pure-play foundry. It manufactures semiconductors from customer designs, including those of NVIDIA and AMD. Samsung Foundry and Intel Foundry Services compete in the same market.

TSMC's N2 process entered volume production in Q4 2025. TSMC schedules volume production of its N2P derivative for the second half of 2026.[161] In Q2 2026, 2nm accounted for 3% of TSMC wafer revenue, compared with 33% for 5nm, 30% for 3nm and 11% for 7nm.[162] TSMC fabricates AI accelerators for

the designers below. FuriosaAI identifies TSMC as a manuf
for RNGD.[37]

chips for Chinese designers, and foundries must review any shipment at 7nm and below to Chinese designers. Alibaba's 2026 AI silicon is fabricated domestically, with capacity at SMIC the stated constraint.[110]

SemiAnalysis reported on March 12, 2026 that front-end N3 wafer capacity has displaced CoWoS packaging as the dominant bottleneck in AI chip supply, with CoWoS tight but easing. TrendForce expects the CoWoS supply-demand gap to narrow from about 20% to about 10% by the end of 2026.[163] Micron reached high-volume production of HBM4 36GB 12H for NVIDIA's Vera Rubin platform on March 16, 2026, at pin speeds above 11 Gb/s.[164]

Expansion plans

TSMC's announced US investment totals $265 billion across 12 leading-edge fabrication and packaging facilities, after an incremental $100 billion Arizona commitment announced on July 16, 2026.[165]

The March 2025 reports of a TSMC-led joint venture to run Intel's foundry division did not produce a deal. TSMC denied active discussions on April 17, 2025, and on September 26, 2025 stated that it "has never entered into talks with any company on establishing a joint venture or engaging in the licensing or

transfer of technology."[166] Intel was recapitalized separately, government taking a 9.9% stake for $8.9 billion in August 2025.[167]

AI chips for in-house infrastructure

Due to US sanctions preventing many Chinese companies from acquiring the most advanced AI chips from AMD and NVIDIA, Chinese buyers have increased their purchases from local producers.

Huawei and Alibaba are covered above. Other Chinese AI chip producers include:

- **Cambricon** (SHA: 688256) reported FY2025 revenue of RMB 6.4972 billion, up 453.21% year over year, and its first full-year profit at RMB 2.0592 billion. Its market capitalization passed RMB 1 trillion on June 30, 2026, a first for the STAR Market.
- **Baidu Kunlunxin** unveiled two chips on November 13, 2025. The Kunlun M100 is optimized for large-scale inference and was slated for launch in early 2026, and the Kunlun M300, built for training and inference of ultra-large multimodal models, is targeted for 2027. Baidu also presented two supernode systems, Tianchi 256 (available in H1 2026) and Tianchi 512 (available in H2 2026), both built from Baidu's existing Kunlun P800 chips.
- **Biren**, founded by NVIDIA alumni, listed on the Hong Kong Stock Exchange main board on January 2, 2026, raising HK$5.58 billion (about US$717 million).

- **Moore Threads** (SHA: 688795) listed on the STAR Mark[illegible]5, 2025. FY2025 revenue was RMB 1.505 billion, up 243.37% year over year. The

AI chips for in-house infrastructure

4.2 billion (US$588-596 million), and has since confidentially filed for a secondary Hong Kong listing.

- **Iluvatar CoreX** (HKEX: 9903) listed on the Hong Kong main board on January 8, 2026, raising about HK$3.68 billion.
- **Enflame** (SHA: 688801) listed on Shanghai's STAR Market on September 11, 2026.[168][169] Its listing notice states that the company was still unprofitable at listing.
- **SMIC**, the foundry most of these designers depend on, had N+3 (5nm-class) in volume production as of June 2026, 7nm capacity of roughly 45,000 to 60,000 wafers per month, and $9.3 billion of 2025 revenue.

Export access and restrictions

The following announcements affected advanced AI chip sales to China in 2025 and 2026. License approvals, shipment limits and tariffs have different scopes.

Licensing changed first. On January 13, 2026 the US Bureau of Industry and Security announced a final rule moving license applications for the NVIDIA H200, AMD MI325X and similar chips from a presumption of denial to case-by-case review, subject to conditions covering exporter certifications, customer-verification checks and independent pre-shipment testing.[170] The rule also caps aggregate total processing performance (TPP) exported to China or Macau at

50% of the aggregate TPP shipped for US end-use for the a
computing commodities, measured through the license application date.[171]

sales to China on December 8, 2025 and restated it on January 14, 2026, while the White House announced a distinct 25% Section 232 tariff on advanced semiconductors at the same performance thresholds on January 14, 2026, with carve-outs including US data centers and US R&D.[172]

China has moved in the other direction, though less formally. Reuters reported on November 5, 2025, citing unnamed sources, that authorities had barred foreign AI chips from state-funded data centers.

On July 14, 2026, Under Secretary of Commerce Jeffrey Kessler told a congressional hearing that “very few shipments against licenses for H200s and equivalents have taken place. It’s a very small quantity of chips.” NVIDIA had booked zero China data center compute revenue as of both its February 2026 and its May 2026 results.

Domestic share of China’s AI accelerator market

Reuters reported IDC’s estimates of AI accelerator card shipments in China.[173] The estimates count accelerator cards shipped.

AI chips for in-house infrastructure

AMD	about 160,000	4%
Total	about 4 million	100%

Download as CSV

Domestic supply is itself concentrated. Huawei accounts for roughly half of Chinese-vendor shipments, with the rest split across Alibaba's T-Head, Baidu Kunlunxin, Cambricon, Hygon, MetaX and Iluvatar CoreX.[173]

Chinese vendor	2025 cards shipped	Share of Chinese-vendor shipments
Huawei	about 812,000	roughly half
Alibaba T-Head	about 265,000	not stated
Baidu Kunlunxin	about 116,000	not stated
Cambricon	about 116,000	not stated
Hygon	not stated	5%

Changelog

39 updates

2026 2025 2024 2023 2022

JUL 28
Added a NextSilicon company profile covering its Maverick-2 accelerator.

AI chips for in-house infrastructure

JUN 25
Added vendor and chip table to mobile AI chip providers section

MAY 8
Added Fractile to the AI chip startups list, expanding the roundup from 20+ to 25+ chip makers.

FEB 26
Updated SambaNova Systems' funding, product, and collaboration details.

JAN 23
Added a section about AI chip architectures: GPUs vs ASICs.

You forgot to include Tesla with their DOJO supercomputer. From the ground-up, the supercomputer was specifically designed for machine learning and image recognition - which means that every component was designed for it including, but not limited to, PCI board design, CPU, RAM, cooling, power, scalable hardware design and software. If I'm not mistaken, the AI is also the second most widely tested and used in the "wild", just below that of Google due to Google using it in their Search.

AI chips for in-house infrastructure

Thank you for your feedback, Dave! Here we are only covering companies that sell the chips that they produce. Therefore, companies like Tesla that build supercomputers for their own use or companies that embed chips in their products are out of our scope.

surprised that brainchip (akida) missing in this report. any reasons?

Reply

Cem Dilmegani

Nov 18, 2022 at 07:36

All included companies here raised $100+M. Last time we collected the data, that wasn't the case for akida. Why don't you reach out to us at info@aimultiple.com and let's discuss why it should be included. Thank you!
